Just realized now. For cases 'c' and 'd': Here is no need to compute F^2 now g^3 respectively. Instead, it can be directly calculated by slufting the elements within each cycle K-1 times, where K is the paser when of the function we are brying to compute (e.g. g^K). Its the original function (e.g. g^K)

2) d 2
$$p = (a b c d)$$
 $r_1 = (b d)(a)(c)$ $r_2 = (a c)(b)(d)$ $r_3 = (a d)(b c)$ $r_4 = (a d)(b c)$ $r_5 = (a d)(b d)$ $r_6 = (a b)(c d)$
